

DISPENSING EQUIPMENT JAX USA

Dispensing Solutions Division

XACT Fluid Solutions, a new division of Behnke Lubricants Inc./ JAX, has engineered lubricant dispensing systems that will reduce consumption and extend the life of industrial and food plant machinery.

"The unique nature of XACT Fluid Solutions for our clients is that both equipment and lubrication solutions can be generated under one roof," said Shaun Beauchamp, Director of Operations for XACT Fluid Solutions. "We have experience designing automated fluid dispensing systems, and work directly with JAX research chemists so we can verify the compatibility of the lubricants and the equipment."

"Many times lubricant providers supply fluids to their customers yet have little or no input as to how the fluid should be applied," Beauchamp said. "JAX provides the best quality lubricants on the market. The purchase of high quality products becomes even more effective when the usable life is extended far beyond competitive products of lesser quality."

Driving the efforts of the new XACT Fluid Solutions Division is the immediate need for fluid dispensing solutions from existing JAX customers. XACT offers solutions primarily for chain lubrication systems. XACT Sniper Series was designed to fit the needs of the current JAX client base. Grease lubrication packages, as well as other systems, are available as well. Recently, specific pork and beef processing industry applications have driven XACT efforts into successful lubrication package solutions.

The largest benefit of doing business with JAX/XACT is consolidation of resources. Clients can inquire about systems from a single source, reducing the time and energy required to relay technical information and secure a solution.

XACT provides system components that will integrate directly into client applications and ensure proper function with available air and electrical resources. That innovative approach has given clients a more reliable and flexible solution.

XACT is a tier-one solution provider, engineering packaged solutions with components selectively chosen from various manufacturers that are supported by existing plant stockrooms. XACT is established to engineer dispensing systems that will allow use of JAX high quality fluids in a manner that will reduce consumption and extend the application of a given fluid volume. As new solutions are created, documented and implemented, information and literature will be made available at: www.xactfluid.com.
